

ABSTRACT

Some embodiments of the present invention provide a spacer configured to mount a fan housing to a surface of a structural support. In some embodiments, the spacer includes a body, a first aperture passing through the body and having a first length through the body, and
5 a second aperture passing through the body and having a second length through the body, wherein the second length is different than the first length. The body can be oriented in a first orientation with respect to the fan housing and structural support or in a second orientation with respect to the fan housing and structural support to mount the fan housing at different distances from a mounting surface of the structural support.
